

Thirty minutes before opening bell...

Compile a watchlist of stocks between \$2 and \$5 first from mobile app market movers/most active (make sure all are positive % gainers)... then from the pro platform's market movers/most active and top % gainers... then from New Highs (High Low tool).

Make sure all stocks are at least 1 million in volume (if between 500,000 and 1 million, make sure 1 minute chart has no broken succession of candles from overnight). Make sure all stocks are positive % gainers (if coming from New Highs and are negative % gainer, then make sure chart is making progress upward for at least the last half hour)

Draw beta baselines for each stock chart.

After opening bell... ignore all stocks falling below baselines and focus on stocks with a good scrimmage pattern (focus on stocks returning down to beta baselines or at beta baselines).

Narrowing stocks down to the \$2 to \$5 range has the effect of narrowing focus and concentration of strategy. Also, if a trade is lost on a small ante (warmup), a comeback is more likely on \$2 range stocks by allowing focus to be narrowed down even further for even greater concentration while also significantly being able to up the ante/shares that will make a comeback possible. This is especially true if time is given for a stock to return to a previous beta baseline. Of course, there are the exceptions if a \$2 range stock ends up not showing a good scrimmage that a little higher priced stock might show at that moment in time or if a previous opportunity is lost.
